Table of Contents

Git Repository : 3

Sketches & UI Mockups: 3

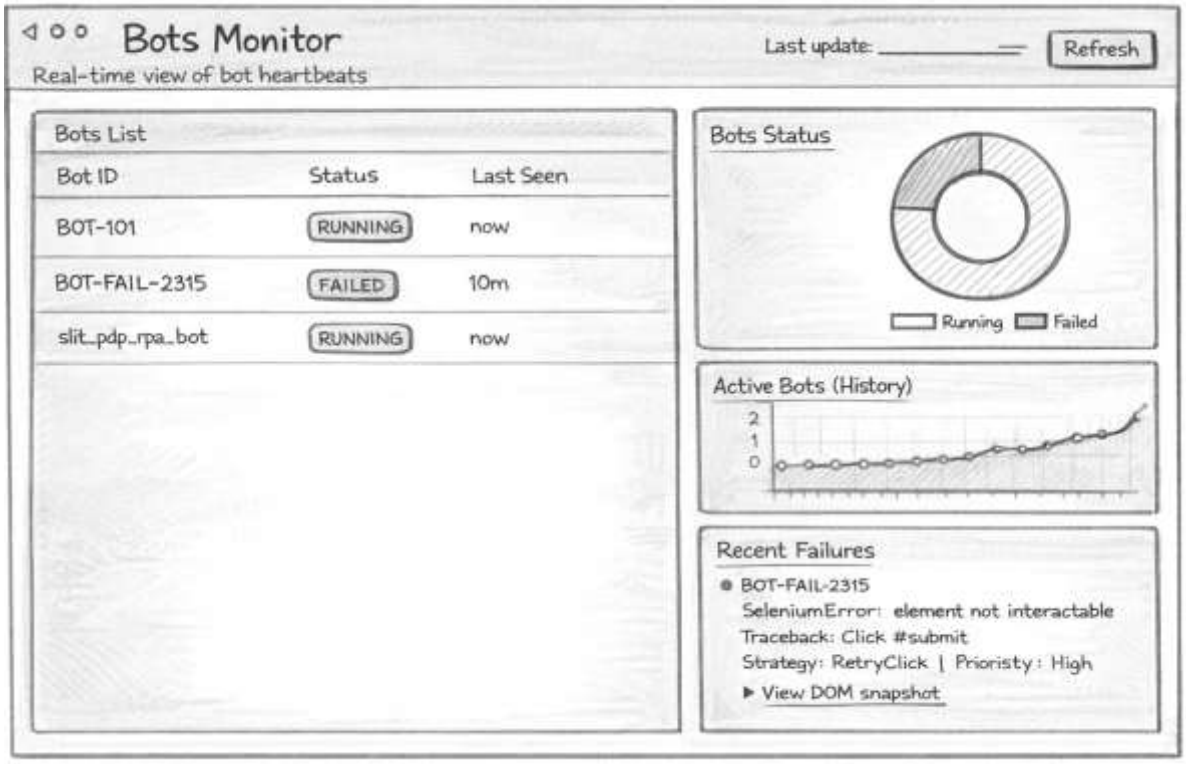
User Feedback: 4

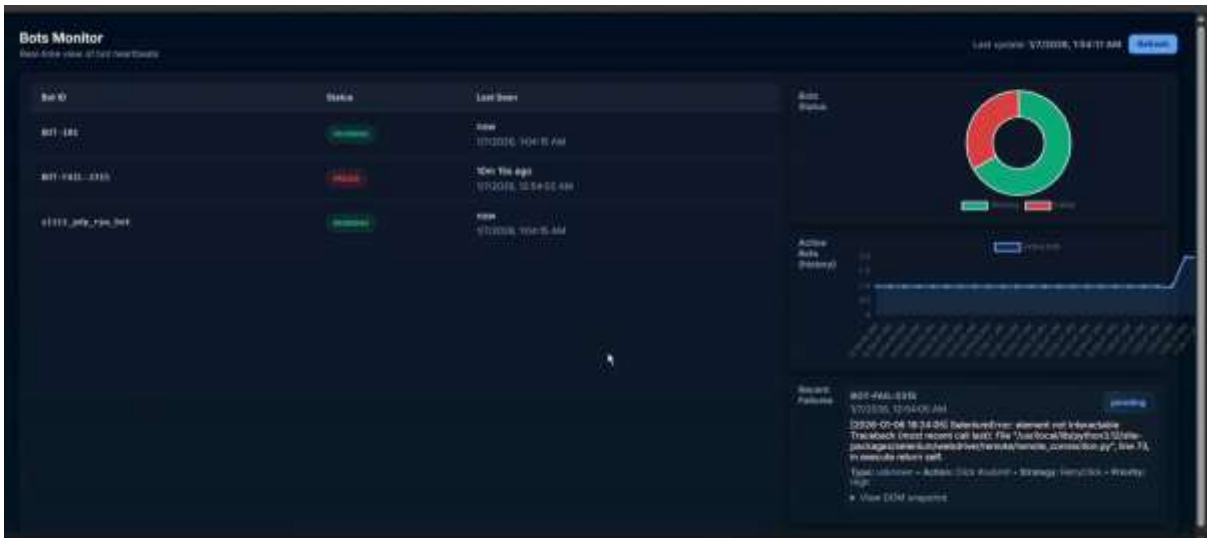
Improvements: 5

1. Git Repository:

https://github.com/thevinduttr/Ominifix-AI_Enhanced_Self_Healing_RPA_Framework.git

2. Sketches & UI Mockups:

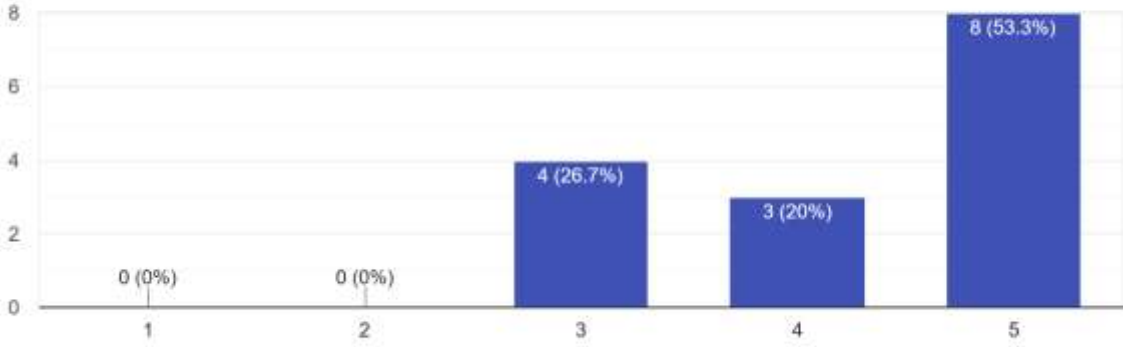




3. User Feedback:

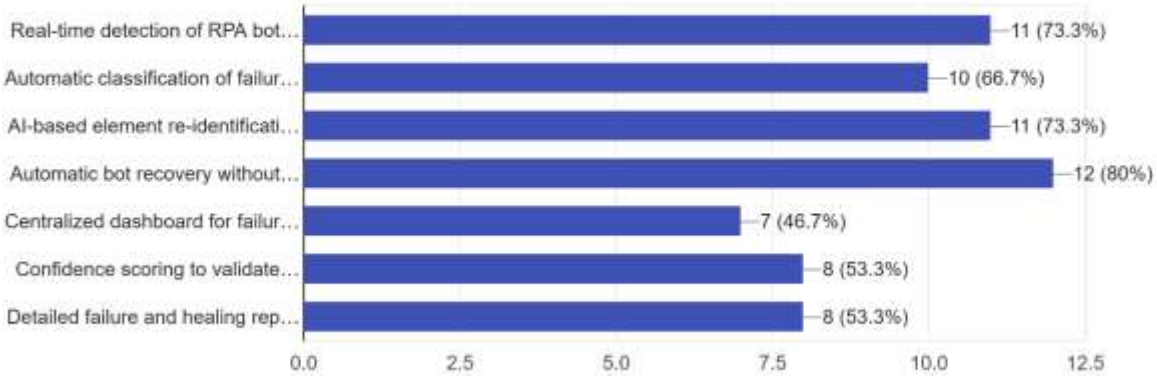
10. How useful would a fully automated self-healing RPA system be for your organization? (A system that detects failures, analyzes causes, hea...utomation, and resumes execution automatically)

15 responses



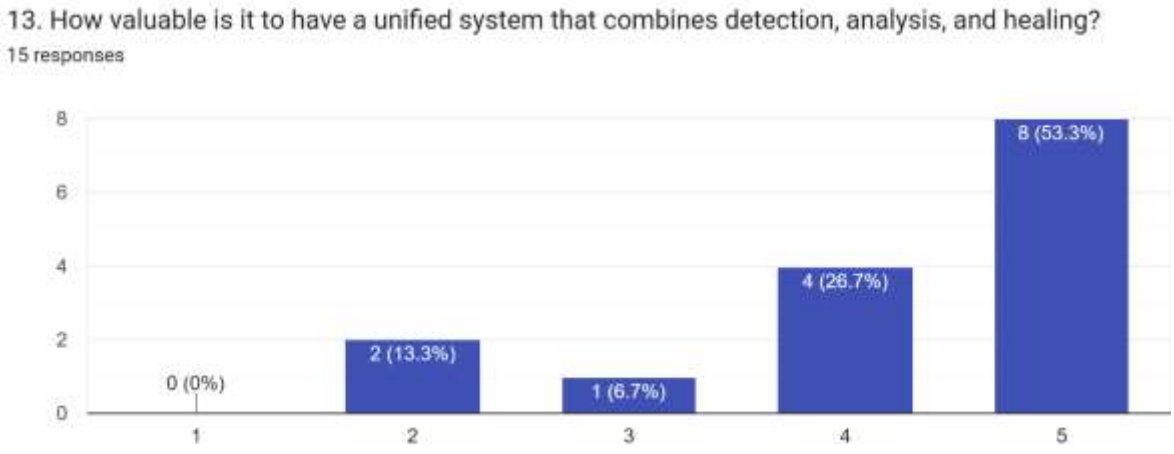
11. Which capabilities of Ominifix would you find most valuable?

15 responses



12. How important is automated decision-making (without human involvement) in bot recovery?

15 responses



4. Improvements:

1. Unified Monitoring Dashboard
    - Combined bot monitoring, failure detection, and recovery visibility into a single screen, reducing the need to switch between tools.
2. Clear Bot Status Visualization
    - Real-time status indicators (Running / Failed) and a pie chart provide quick situational awareness for operators.
3. Failure-Centric View
    - Recent failures are highlighted with error type, failed action, and priority, helping teams focus on the most critical issues first.
4. Trend Analysis Support
    - Active bots history graph helps identify instability patterns and recurring failure trends over time.
5. Context-Aware Failure Details
    - Each failure includes execution context and recovery strategy reference, improving troubleshooting speed.
6. Scalable UI Design
    - Dashboard layout supports adding more bots, metrics, and healing modules without redesign.
7. Improved Usability for Non-Technical Users
    - Visual summaries (charts, status labels) reduce dependency on logs or raw error messages.
8. Foundation for Advanced Features
    - UI is designed to later support automated healing status, confidence scores, and visual-based recovery without major UI changes.
